

M6A3: Final Project Design System – WAKE Protocol

Name: Kumaarr, Kkshitij

Subject: 6APSI

Section: CS – 401

Design System

Step A: Choosing your style approach

My approach: CSS Modules / plain CSS

I will use plain CSS with CSS custom properties to define the design tokens for WAKE Protocol. This will keep the styling simple and consistent across all screens while allowing colours, spacing, and typography to be reused throughout the application.

Step B: Color Tokens

Token	Role	Your colour (hex)
--color-primary	Links, buttons, active states	#00F0FF
--color-accent	Highlights and important actions	#38BDF8
--color-bg	Main page background	#070B14
--color-surface	Cards, panels, and containers	#00D2FF
--color-text	Main body text and headings	#FFFFFF

Visual Swatches:

HEX:
#00F0FF

HEX:
#38BDF8

HEX:
#070B14

HEX:
#00D2FF

HEX:
#FFFFFF

Step C: Type scale

Style	Size	Weight	Used for
Heading	20px	Bold	Screen titles, section titles, alarm names
Body	14px	Regular	Alarm details, repeat days, descriptions, buttons
Small	11px	Regular	Labels, status text, captions, secondary information

The WAKE Protocol typography uses three consistent text sizes to create a clear visual hierarchy. Larger bold text is used for important screen and section titles, while regular body text is used for alarm information and descriptions. Smaller text is reserved for labels, captions, and secondary information.

Visual Swatches:

FONT: TREBUCHET MS

HEADING - 20PX

BODY - 14PX

SMALL - 11PX

Step D: Spacing rule

Base unit: 8px. I will use multiples of 8px for padding, gaps, and margins throughout the interface. Tight spacing will use 8px, standard section spacing will use 32px, and screen edge padding will use 24px.

Spacing	Value	Token
Tight spacing (between related items)	8px	--space-1
Standard spacing (between sections)	32px	--space-4
Screen edge padding	24px	—

Visual Swatches:

8PX

24 PX

32 PX

Step E: Reusable components

Component	Level	Appears on	Props it takes
Button	Atom	Home, Manage Alarms, Create Alarm, Edit Alarm, Active Alarm	variant, onClick, children
AlarmCard	Molecule	Home, Manage Alarms	alarm, onEdit, onDelete, onToggle
AlarmInfo	Molecule	Home, Manage Alarms	name, time, repeatDays
AlarmStatusToggle	Molecule	Manage Alarms, Edit Alarm	enabled, onChange
AlarmActions	Molecule	Manage Alarms, Home	onEdit, onDelete

Visual Swatches:

BUTTON AND ACTIONS

ALARM INFO AND CARD

ALARM STATUS TOGGLE

Step F: Responsive plan

- **Below 640px (phone):** Content stacks into a single column, alarm cards stack vertically, and form sections use the available screen width.
- **Above 640px:** The layout expands naturally while keeping the same structure and spacing.

Breakpoint: 640px

The layout will be responsive and fit within a 375px-wide screen with no horizontal scrolling.
